PROFESSIONAL SUMMARY

Senior Software Engineer focused on fintech and digital banking platforms, including white-label multi-tenant banking, crypto exchange, and BaaS products. Deep experience with Angular, React, TypeScript, Node.js/NestJS, Java/Spring Boot, PostgreSQL, and Redis, plus microservices, event-driven architecture, and REST API design. Former Tech Lead: led a monolith-to-microservices migration, mentored cross-functional teams, and owned CI/CD and Kubernetes-based delivery on AWS. Founder of TicoAI, a production desktop AI assistant with paying users.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Java, Python, C#, SQL, PHP, C++
Front-End: Angular, React, Next.js, NgRx, Tailwind CSS, HTML5, CSS3, SCSS, Radix UI, Micro-frontends
Back-End: Node.js, NestJS, Express, Java, Spring Boot, REST APIs, WebSockets, Prisma, PostgreSQL, MongoDB, Redis, RabbitMQ, Microservices, Event-Driven Architecture
DevOps & Cloud: Docker, Kubernetes, AWS, GCP, CI/CD, GitHub Actions, Terraform, HashiCorp Vault, Monitoring & Observability
Testing & Practices: Jest, Cypress, Unit & Integration Testing, System Design, Code Review, Agile, Scrum

PROFESSIONAL EXPERIENCE

Senior Software Engineer — Axia Digital Solutions

Oct 2025 – Oct 2026 | Remote, Brazil

- Architected scalable digital banking and fintech solutions using Angular and TypeScript within a white-label, multi-tenant platform serving internet banking, crypto, and BaaS providers.
- Led the migration of an 8-year-old Angular codebase from version 8 to 17 across 15+ modules (exchange, digital bank, wallet, tokenization, back office) with no delivery freeze; cut build time from 60s to 5s.
- Developed and maintained Java/Spring Boot microservices alongside the Node.js stack, implementing background workers and integrating third-party APIs into existing banking services.
- Led design of modular, white-label front-end applications supporting multiple client environments (Tokeniza, Dillianz, Globoo), ensuring seamless customization and brand consistency.
- Engineered complex multi-step signup and onboarding flows with integrated KYC/IDWall verification, feature flag management, and dynamic form validation.
- Implemented CI/CD pipelines with Docker and GitHub Actions, automating build, test, and deployment across dev, homolog, and production environments.

Tech Lead & Senior Software Engineer — Globoo

Feb 2025 – Oct 2025 | Remote, Brazil

- Led architecture and development of Globoo's digital banking platform, ensuring scalability, security, and regulatory compliance (CVM).
- Led a monolith-to-microservices migration, decomposing core banking services (digital wallet, escrow, crypto-fiat integrations) into modular, independently deployable services.
- Wrote and maintained Java/Spring Boot services within the microservices ecosystem, building workers and API integrations, and owning CI/CD and DevOps end to end.
- Implemented robust KYC, AML, and transactional fraud prevention features, enhancing platform trust and user safety.
- Technical lead and de facto delivery head for a 40-person organization: 10 developers and 5 designers reporting to me technically, with marketing, compliance and HR aligned through me on product priorities, regulatory deadlines and hiring.
- Mentored developers and designers within an Agile/Scrum culture, running planning, reviews and architecture decisions across the whole product.
- Led DevOps with Kubernetes and Docker, reducing deployment friction and improving delivery speed by over 40%.
- Coordinated the launch of DeFi and tokenization features, boosting user engagement and product adoption.

Senior Software Engineer — Milliark Investments

Jun 2024 – Jan 2025 | Remote, Brazil

- Led a team of 10 engineers building trading platforms, investor portals, and back-office systems (Node.js + Angular).
- Implemented automated CI/CD with Docker and Kubernetes, reducing deployment times by 35%.
- Integrated real-time data streaming (WebSockets) for high-frequency financial transactions and analytics.

Lead Software Engineer — Bella Parmegiana (restaurant group, 4 units)

Jan 2024 – Jun 2024 | Dourados, Brazil

- Owned the technology stack for a four-restaurant group, coordinating 3 developers: scoped, architected and delivered the internal platform, back office and in-restaurant ordering system.
- Built the back-office and admin dashboards for inventory, spend and receivables across all units, giving owners a single real-time view of operations and cash.
- Integrated a payment gateway to receive e-delivery orders and reconcile them with the internal control platform, replacing manual entry.

- Designed and shipped tablet menus connected to the in-restaurant service flow: table orders, per-waiter profiles, dish customization and star-rated service feedback, synced live with the kitchen and back office.
- Stack: Node.js on a serverless architecture (AWS Lambda) with VM-hosted services, React on the front end.

Full Stack Software Engineer — Aldax Distribuidora

Jan 2023 – Jan 2024 | Dourados, Brazil

- Designed and built the company's first e-commerce platform from scratch — the distributor sold exclusively in person before — covering architecture, catalog, checkout, order management and ERP integration.
- Architected an event-driven backend with RabbitMQ to synchronize 500+ daily online orders with the existing ERP, decoupling the storefront from legacy systems and eliminating manual order entry.
- Built the full stack in TypeScript: Node.js services on GCP for the backend and the customer-facing storefront and internal admin on the front end.
- Reduced cloud costs by 15% through performance optimizations and removed 3,000+ lines of redundant code during the rollout.
- Set up automated testing (Jest, Cypress) reaching 60% coverage, keeping production incidents low as the channel scaled.

Full Stack Web Developer — Partido dos Trabalhadores (PT)

Jan 2022 – Jan 2023 | Campo Grande, Brazil

- Built and maintained CRUD systems and internal tools for party operations (contacts, events, volunteer and content management) with JavaScript, Node.js and relational databases.
- Developed the campaign website and digital assets for the mayoral candidacy of Bela Barros, plus institutional pages and landing pages for party initiatives.
- Ran 300+ paid-traffic campaigns for lead generation and audience conversion, with tracking and reporting tied back to the campaign systems.
- Navigated long approval cycles with party leadership and legal, scoping, documenting and defending technical proposals until sign-off — early practice in stakeholder management under electoral compliance rules.

Freelance Web Developer — Self-Employed

2020 – Jan 2022 | Dourados / Campo Grande, Brazil

- Delivered websites and internal systems for 50+ local businesses: inventory control, employee onboarding and admissions, order and cash management, and general back-office tooling — JavaScript, Node.js, HTML5/CSS3.
- Handled the full client cycle independently: requirements, development, deployment, training and post-launch support.

OPEN SOURCE & INDEPENDENT PRODUCTS

Maintainer & Core Contributor — Énois — github.com/Rede-ENois (GPL-3.0)

Oct 2026 – Present | enois.ia.br

- Open-source Brazilian social network for people in tech — feed, groups, communities, messaging, jobs, mentoring, marketplace and human-led moderation — built with no ads, no paid tiers and LGPD data minimization as an architectural rule.
- Stack: Java 25 / Spring Boot 4 in a hexagonal architecture with JPA + Flyway, MariaDB, Resilience4j, AWS S3, Web Push and OpenTelemetry/Prometheus; React 19 with TanStack Router/Start/Query, Vite, Tailwind 4, Radix UI, Zustand, Zod and Vitest.
- Act as a maintainer across both repositories: review and merge community pull requests, enforce the contribution and security guidelines, triage incoming bugs, and shape the feature roadmap together with the core team.
- Designed and shipped the platform's anti-abuse layer so the network can grow without becoming a spam target: per-user rate limiting, content deduplication, Cloudflare Turnstile, signup honeypot, device fingerprinting with new-device alerts, and behavioral detection that auto-reports suspicious accounts to moderators.
- Hardened moderation and trust: a ban cascade that archives a user's content and clears pending and accepted connections in one operation, plus a birth-date gate that brings the platform into compliance with Brazil's child-protection law (ECA Digital).

Founder & Solo Engineer — TicoAI (ticoai.app)

2025 – Present | Remote, Brazil

- Designed, built, and shipped a production Windows desktop AI assistant in C# (.NET 8, WPF) integrating the Claude API and OpenAI Whisper/TTS for real-time voice interaction.
- Architected a serverless backend on Cloudflare Workers with a Next.js web app, Supabase (authentication and database), and subscription billing via Stripe and PIX (AbacatePay).
- Own the full product lifecycle end to end: system design, development, CI/CD, deployment, payments, and customer support.

EDUCATION

Technology Degree (Tecnólogo) in Systems Analysis and Development — Unicesumar

2026 – 2028 (in progress) | Distance learning

Law — Universidade Católica Dom Bosco (UCDB)

2018 – 2020 | Campo Grande, Brazil | Coursework, not completed

CERTIFICATIONS

- CS50: Introduction to Computer Science — Harvard University (edX), 2020
- Certified Scrum Master (CSM) — Scrum Alliance, 2021
- Power BI Data Analyst — Microsoft Learn, 2022
- Full Stack Web Development — Rocketseat, 2022
